

Reproducibility Checklist

This is a copy of the reproducibility checklist that the authors will be asked to answer during paper submission. See the [Reproducibility Criteria](#) section in the Call for Papers for more details.

For all reported experimental results:

- A clear description of the mathematical setting, algorithm, and/or model
- A link to a downloadable source code, with specification of all dependencies, including external libraries (recommended for camera ready, though welcome for initial submission)
- A description of computing infrastructure used
- The average runtime for each model or algorithm, or estimated energy cost
- The number of parameters in each model
- Corresponding validation performance for each reported test result
- A clear definition of the specific evaluation measure or statistics used to report results.

For all results involving multiple experiments, such as hyperparameter search:

- The exact number of training and evaluation runs
- The bounds for each hyperparameter
- The hyperparameter configurations for best-performing models
- The method of choosing hyperparameter values (e.g. manual tuning, uniform sampling, etc.) and the criterion used to select among them (e.g. accuracy)
- Summary statistics of the results (e.g. mean, variance, error bars, etc.)

For all datasets used:

- Relevant statistics such as number of examples and label distributions
- Details of train/validation/test splits
- An explanation of any data that were excluded, and all pre-processing steps
- For natural language data, the name of the language(s)
- A link to a downloadable version of the dataset or simulation environment
- For new data collected, a complete description of the data collection process, such as instructions to annotators and methods for quality control
